Reading Files Python

Estimated time needed: **40** minutes

Objectives

After completing this lab you will be able to:

- Read text files using Python libraries

Table of Contents

Download Data

In [1]:

```python
import urllib.request
url = 'https://cf-courses-data.s3.us.cloud-object-storage.appdomain.cloud/IBMDeveloperSkil
lsNetwork-PY0101EN-SkillsNetwork/labs/Module%204/data/example1.txt'
filename = 'Example1.txt'
urllib.request.urlretrieve(url, filename)
```

Out[1]:

```
('Example1.txt', <http.client.HTTPMessage at 0x7f0c90605780>)
```

In [1]:

```python
# Download Example file

!wget -O /resources/data/Example1.txt https://cf-courses-data.s3.us.cloud-object-storage.a
ppdomain.cloud/IBMDeveloperSkillsNetwork-PY0101EN-SkillsNetwork/labs/Module%204/data/examp
le1.txt
```

```
/resources/data/Example1.txt: No such file or directory
```

Reading Text Files

One way to read or write a file in Python is to use the built-in open function. The open function provides a **File object** that contains the methods and attributes you need in order to read, save, and manipulate the file. In this notebook, we will only cover **.txt** files. The first parameter you need is the file path and the file name. An example is shown as follow:

The mode argument is optional and the default value is **r**. In this notebook we only cover two modes:

- **r**: Read mode for reading files
- **w**: Write mode for writing files

For the next example, we will use the text file **Example1.txt**. The file is shown as follows:

This is line 1
This is line 2
This is line 3

We read the file:

In [ ]:

```
# Read the Example1.txt

example1 = "Example1.txt"
file1 = open(example1, "r")
```

We can view the attributes of the file.

The name of the file:

In [ ]:

```
# Print the path of file

file1.name
```

The mode the file object is in:

In [ ]:

```
# Print the mode of file, either 'r' or 'w'

file1.mode
```

We can read the file and assign it to a variable :

In [ ]:

```
# Read the file

FileContent = file1.read(fi)
FileContent
```

The **/n** means that there is a new line.

We can print the file:

In [ ]:

```python
# Print the file with '\n' as a new line

print(FileContent)
```

The file is of type string:

In [ ]:

```python
# Type of file content

type(FileContent)fi
```

It is very important that the file is closed in the end. This frees up resources and ensures consistency across different python versions.

In [ ]:

```python
# Close file after finish

file1.close()
```

A Better Way to Open a File

Using the `with` statement is better practice, it automatically closes the file even if the code encounters an exception. The code will run everything in the indent block then close the file object.

In [ ]:

```python
# Open file using with

with open(example1, "r") as file1:
    FileContent = file1.read()
    print(FileContent)
```

The file object is closed, you can verify it by running the following cell:

In [ ]:

```python
# Verify if the file is closed

file1.closed
```
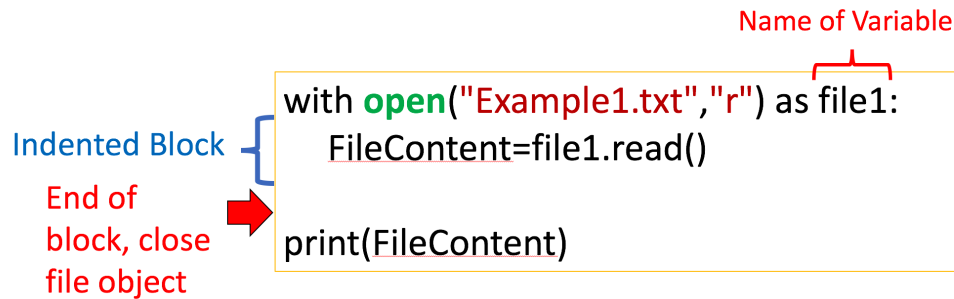

We can see the info in the file:

In [ ]:

```
# See the content of file

print(FileContent)
```

The syntax is a little confusing as the file object is after the `as` statement. We also don't explicitly close the file. Therefore we summarize the steps in a figure:

We don't have to read the entire file, for example, we can read the first 4 characters by entering three as a parameter to the method **.read()**:

In [ ]:

```
# Read first four characters

with open(example1, "r") as file1:
    print(file1.read(4))
```

Once the method `.read(4)` is called the first 4 characters are called. If we call the method again, the next 4 characters are called. The output for the following cell will demonstrate the process for different inputs to the method `read()` :

In [ ]:

```
# Read certain amount of characters

with open(example1, "r") as file1:
    print(file1.read(4))
    print(file1.read(4))
    print(file1.read(7))
    print(file1.read(15))
```

The process is illustrated in the below figure, and each color represents the part of the file read after the method `read()` is called:

New Line
1)file1.read(4)
2) file1.read(4)
3)file1.read(7)
4)file1.read(15)

Here is an example using the same file, but instead we read 16, 5, and then 9 characters at a time:

In [ ]:

```python
# Read certain amount of characters

with open(example1, "r") as file1:
    print(file1.read(16))
    print(file1.read(5))
    print(file1.read(9))
```

We can also read one line of the file at a time using the method `readline()` :

In [ ]:

```python
# Read one Line

with open(example1, "r") as file1:
    print("first line: " + file1.readline())
```

We can also pass an argument to `readline()` to specify the number of charecters we want to read. However, unlike `read()`, `readline()` can only read one line at most.

In [ ]:

```python
with open(example1, "r") as file1:
    print(file1.readline(20)) # does not read past the end of line
    print(file1.read(20)) # Returns the next 20 chars
```

We can use a loop to iterate through each line:

In [ ]:

```python
# Iterate through the lines

with open(example1,"r") as file1:
        i = 0;
        for line in file1:
            print("Iteration", str(i), ": ", line)
            i = i + 1
```

We can use the method `readlines()` to save the text file to a list:

In [ ]:

```python
# Read all lines and save as a list

with open(example1, "r") as file1:
    FileasList = file1.readlines()
```

Each element of the list corresponds to a line of text:

In [ ]:

```python
# Print the first line

FileasList[0]
```

Print the second line

FileasList[1]

In [ ]:

```python
# Print the third line

FileasList[2]
```

The last exercise!

Congratulations, you have completed your first lesson and hands-on lab in Python. However, there is one more thing you need to do. The Data Science community encourages sharing work. The best way to share and showcase your work is to share it on GitHub. By sharing your notebook on GitHub you are not only building your reputation with fellow data scientists, but you can also show it off when applying for a job. Even though this was your first piece of work, it is never too early to start building good habits. So, please read and follow this article (https://cognitiveclass.ai/blog/data-scientists-stand-out-by-sharing-your-notebooks/?utm_medium=Exinfluencer&utm_source=Exinfluencer&utm_content=000026UJ&utm_term=10006555&utm_id=NA SkillsNetwork-Channel-SkillsNetworkCoursesIBMDeveloperSkillsNetworkPY0101ENSkillsNetwork19487395-2021-01-01) to learn how to share your work.
